5. Waste Reduction program

(i) Efforts taken in 2015 to reduce waste volume and toxicity:

We continue to transition to low-lead metal alloys with a lead content of less than one percent. The lead in sand molds and refractory materials from low lead alloy castings is below RCRA regulatory levels and the resulting waste products can be reused or disposed as non-hazardous. As the market continues to move toward low-leaded products, our shipments of associated hazardous wastes are projected to decline.

(ii) A description of the changes in volume and toxicity of waste actually achieved during the year in comparison to previous years:

The foundry generated 101 tons of lead contaminated sand and refractory materials in 2015, lower than the 110 tons generated in CY 2014. We believe this was primarily due to the transition to low lead castings described above.
